

ESD/ESI-15 to ESD/ESI-120

Self-aligning Roller Beds

ESD-15 to ESD-120 (Drive) and ESI-15 to ESI-120 (Idler) are standard self-aligning roller beds.

Self-Aligning is designed for safer handling and gives better side support in thinner wall thicknesses. It reduces time when different diameters need to be produced. Just like the ECD, they have the same smart and robust design made of high-quality key components including high-load polyurethane rollers as well as direct drive and a flexible integration.

- Interface connection to ESAB CaB equipped with weld controller PEK for complete integration
- Two wireless remote-control pendants using Radio Frequency (RF), and an inductive charger comes as standard
- Control panel with PLC and solid-state inverter for precise speed control
- Wheel holder C - C adjustable in steps to cover various work piece diameters
- High quality gear motors from a European supplier with a minimum of backlash
- Optional Motorised/Idler Rail Bogie versions
